

## COMPOSITION OF MINERAL-VITAMIN MIXTURE FOR GOATS

J. Kulpys, A. Juozaitis

**Summary.** The productivity of goats highly depends on proper feeding. However the fodder used at present does not contain balanced amounts of essential minerals and vitamins. Therefore, a balanced mineral-vitamin mixture was prepared and fed to both not coupled and pregnant goats in the last 7-8 weeks in doses of 8-10 g/day. The dose for lactating goats (up to the 3 l of milk/day) was 12 g/day.

The mixture is mixed in concentrate or succulent feeds.

The mineral-vitamin mixture helps to balance rations and has a positive effect on the health of goats.

**Keywords:** goats, rations, minerals.
