

## AN IMMUNE PREPARATION AGAINST PIG VIRAL DISEASES

V. Sereika, M. Tiukšienė, R. Burba

**Summary.** Various combinations of viral and bacterial diseases are possible on pig-breeding farms. Along with vaccines there exists a necessity for other specific means of prophylaxis-immune sera.

An immune serum against entero- and coronaviral gastro-enteritis has been produced. After administering the above mentioned serum only 6,7-11,2 % of experimental piglets were lost, whereas the number of control piglets lost amounted to 20,3-30,1 %.
