

IMPACT OF IODINE AND CHOLINERGIC SUBSTANCES ON ENDOMETRITIS TREATMENT IN COWS

R. Mockeliūnas, V. Rimavičius, P. Šakys

Summary. Testing the new preparation in the treatment of 27 cows for endometritis resulted in recovery of 88,9 % of the cows after 16,9 days of administering the given preparation. 73,7 % of the cows got impregnated by the first insemination after the treatment. The results obtained are very close those for healthy cows and meet the medical preparation requirements.

Keywords: bovine endometritis, iodine and cholinergic substances.
