

AMPLITUDE OF CHANGES IN ATMOSPHERIC TEMPERATURE

S. Bagdonas

Summary. Ten day and monthly changes in the atmospheric temperature amplitude have been investigated. The amplitude is lower in winter than in summer. The peak in the amplitude changes is reached in the first and second decades of May due to the invasion of cold arctic weather. In summer the amplitude rises under the influence of vegetation. In autumn the amplitude changes are high as well.

Keywords: atmospheric temperature, amplitude, peak in the amplitude.
