Summary. Personal enterprise „Rolekspa“ and Lithuanian Veterinary Institute have created and tested an ointment „Salicer“ for the treatment of cow udder and teat skin diseases. It was determined, that Salicer suppressed the growth of microbes and fungi in vitro better than the ointment „Evija“. The best suppression was on streptococci and fungi. Fractures, little wounds of udder and teat skin, udder swelling recovered within 3–6 days of ointment application. Our investigations show that the ointment causes no local irritation of skin. Expiration period is not less than 1 year.

Keywords: udder and teat skin diseases, antiseptic ointment.
