

THE ELECTRIC WATER USE *IN VITRO*

Jūratė Klimaitė, Romualdas Maruška, Vytuolis Žilaitis, Alfredas Motiejūnas

Summary. We evaluated how to make electric water at the laboratory. We mixed acidic and alkaline water with the medium of cultivated microbes and observed how it influenced the microbes development. The acid and alkali water remained much the same for 2 weeks. The acid water stopped all microbes development. The alkali water didn't influence microbes noticeably. The distil water (pH parallel) didn't change the microbes development. The electricity water (acid fraction) has a biological effect.

Keywords: activity water, acidic and alkaline water, microbes.
